

## Today's Content

- Hash Map Intro
- frequency of each query
- first non repeating element
- distinct elements
- subarray with sum=0.
- Strings task.

## Quote :-

Choose the non-emotional response to  
any given situation and see how  
much easier your life becomes.

→ Double Semion

String sto = "harryish"

sto = sto + 'a'  $\xrightarrow{O(n)}$ .

String are immutable

Java, python.

String builder, String buffer.

arr[m]

sto = "";

for (i=0; i<m; i++) {

sto += arr[i];

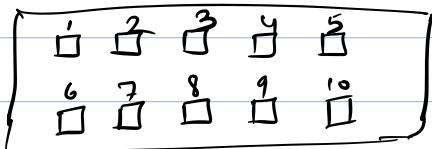

3

$O(m^2)$ .

$O(n)$ .

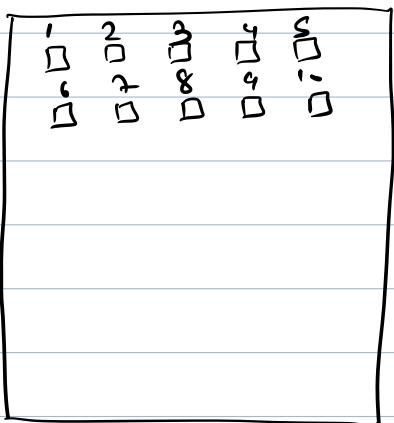

## HashMap Intro :-

a) ShriRam + katesh → Registered.

| Room No | Available |
|---------|-----------|
| 1       | ✗         |
| 2       | ✗         |
| 3       | ✓         |
| 4       | ✗         |

b)

→ Room Number [1 1000]

bool room[100]

room[1] = false

room[50] = false.

c) Covid came → now in less.

1000 lucky numbers.

range [1 to 10<sup>9</sup>]

→ aer [10<sup>9</sup>]

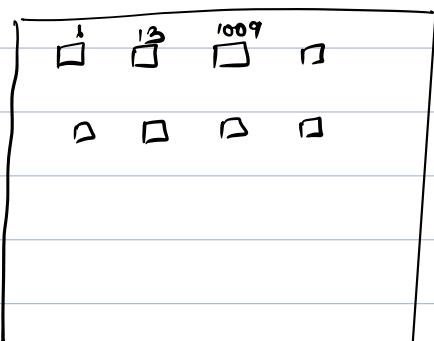

→ waste of space.

HashMap of key, value >

{79, occupied}

{87, not occupied}

{1001, occupied}

T.C O(1)

S.C → O(n).

key:- should be unique  
value:- can be anything.

Q1) Store population of every country.

key : Country Name  $\rightarrow$  String

value : Population  $\rightarrow$  Int

HashMap <String, Int> hm

Q2) No. of States in each country.

key  $\rightarrow$  Country Name  $\rightarrow$  String

values  $\rightarrow$  No. of States  $\rightarrow$  Int

HashMap <String, Int> hm

Q3) For every country we want to know all state names.

key  $\rightarrow$  Country Name  $\rightarrow$  String

value  $\rightarrow$  Name of States  $\rightarrow$  List <String>

HashMap <String, List <String>>

→ Dynamic Array.

↳ C++ → vector

↳ Python → List

↳ Java → ArrayList

Q4) for every country store population of each state

key → Country Name → String

Value → Population of each state → HashMap<String, Int>

HashMap<String, HashMap<String, Int>>  
key    value.

Obs1:- Value can be anything.

Obs2:- key can be only primitive data type.  
int / long / float / double / string / char

key  
India

USA

key - value  
Andhra - 500  
Telangana - 1000  
Karnataka - 1600

Texas - 60  
Cal - 50  
New - 70

## HashMap functionality

$\langle \text{key}, \text{value} \rangle$

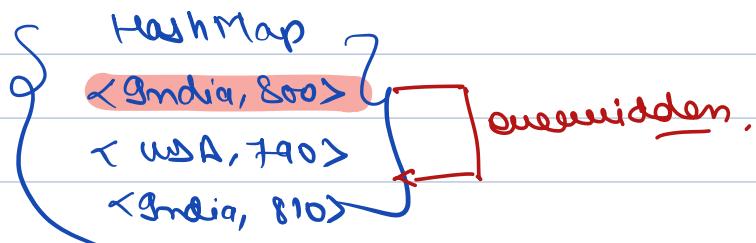

`size()  $\Rightarrow$  no. of keys`

`insert(key, value)`

`search(key)`

`delete(key)`

`update(key, value)`

{ when we insert, same key }  
 again it will override  
 previous val }

Note :- A single operation in hashmap /

hashset  $\Rightarrow$  O(1)

→ Order is not ensured in  
hashmap / hashset .

## hashset

$\langle \text{keys} \rangle$

`size()`

`insert(key)`

`search(key)`

`delete(key)`

→ ⚡ hashing library name in diff languages

|            |         |               |            |     |
|------------|---------|---------------|------------|-----|
| PseudoCode | Java    | C++           | Python     | JS  |
| HashMap    | HashMap | unordered-map | dictionary | Map |
| Hash Set   | HashSet | unordered-set | set        | Set |

C#

Dictionary

HashSet

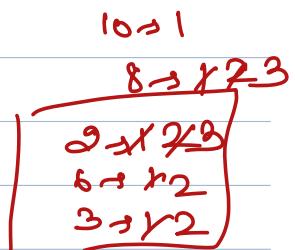

10) find frequency of numbers.

When  $N$  array elements &  $Q$  queries,  
for each query we have to find  
freq. of that ele. in array.

constraints

$$1 \leq N, Q \leq 10^5, 1 \leq \text{ele.} \leq 10^5$$

$$\text{arr}[10] = \{ \underline{2}, \underline{6}, \underline{3}, \underline{8}, \underline{2}, \underline{8}, \underline{2}, \underline{3}, \underline{8}, \underline{10}, \underline{6} \}$$

0 : 4

idea 1:- for every query  
iterate & get count

2 : 3

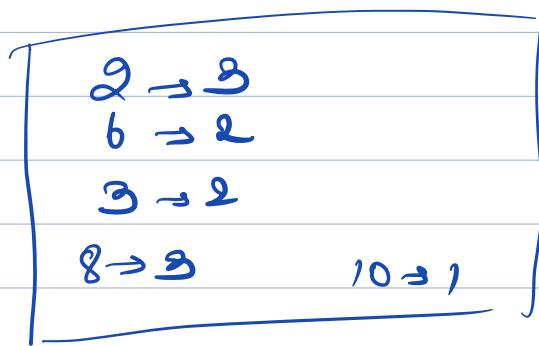

T.C  $\rightarrow O(N)$ , S.C  $\rightarrow O(1)$ .

8 : 3

3 : 2

idea 2:- use a hashmap

5 : 0

key  $\rightarrow$  array element  $\rightarrow$  int

value  $\rightarrow$  freq. of element  $\rightarrow$  int

HashMap  $\leftarrow \text{int, int} \rightarrow \text{hm};$

```
void Point freq( int arr[], int Q[] ) {
```

```
    int n = arr.length;
    int m = Q.length;
    HashMap<int, int> hm;
    for (i=0; i<n; i++) { 3 O(n)
        if (hm.search(arr[i]) == True) {
            hm[arr[i]] += 1;
```

3 else {

```
    hm[arr[i]] = 1
```

3

```
for (i=0; i<m; i++) { 3 O(m)
```

```
    if (hm.search(Q[i]) == True) {
```

```
        point(hm[Q[i]])
```

3 else {

```
    point(0)
```

3

3

T.C  $\rightarrow$  O(n+m)

S.C  $\rightarrow$  O(m).

Break

10:16 - 10:26 pm

Q) find the first non-repeating element,  
↳ first element from start, non-repeating.

$$\text{arr}[6] = \{1, 2, 3, 1, 2, 5\}, \text{ans} = 3$$

$$\text{arr}[7] = \{2, 6, 8, 4, 7, 2, 9\}, \text{ans} = 6$$

$$\text{arr}[8] = \{4, 3, 3, 2, 5, 6, 4, 5\}, \text{ans} = 2$$

Idea :- ~~1)~~ Insert all elements in hashmap & iterate on hashmap to get 1st key with val = 1.

$$\text{arr}[6] = \{1, 2, 3, 1, 2, 5\}$$

HashMap

$\langle 1, 2 \rangle, \langle 5, 1 \rangle, \langle 2, 2 \rangle, \langle 3, 1 \rangle$

Note:- Order of insertion of keys is not maintained.

2) Insert all elements in hashmap. & generate an array & get first element with freq = 1.

Step1:- Insert all elements in map. T.C  $\Theta(n)$

Step2:- Generate an arr[] and get T.C  $\Theta(n)$  1st element with freq 1.

T.C  $\Theta(n)$

S.C  $\Theta(n)$

To do  
↑  
Code

Ques) Given arr[] elements, find no. of distinct elements.

arr[5] = { 3, 5, 6, 5, 4 }, ans = 4

arr[5] = { 1, 1, 1, 2, 2 }, ans = 2

arr[3] = { 3, 3, 3 }, ans = 1.

Idea :- insert all elements in set.

arr[7] = { 6, 3, 2, 3, 8, 6, 9 }

Hashset (int) hs :

{ 6, 3, 7, 8, 9 }  $\rightarrow$  hs.size()  $\geq 5$ .

Note:- In hashset, if same key is inserted, multiple times, we will still have 1 occurrence

Pseudocode :-

```
Hashset<int> hs;           T.C → O(n)
for (i=0; i < n; i++) {     S.C → O(n)
    hs.insert(arr[i]);
}
return hs.size();
```

Ques) Given  $arr[n]$  elements, check if all elements are distinct or not.

$arr[5] = \{6, 8, 9, 2, 7\}$  = return True  
 $arr[7] = \{3, 1, 6, 1, 4, 9, 6\}$  = return False.

Idea:- insert all elements in  $hs$ :

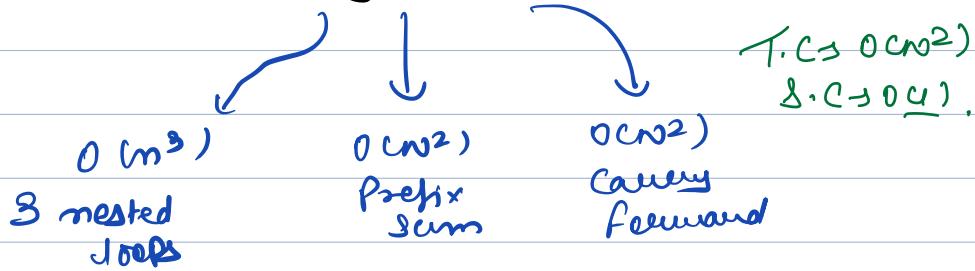

if ( $hs.size == n$ ) {  
 // all elements are distinct  
 return True;  
} else {  
 return False.

1.  $C \rightarrow O(n)$   
2.  $S.C \rightarrow O(n)$

Q) Given  $a[1:n]$  elements, check if there exists a subarray with  $\text{sum} = 0$ .

|             |   |   |   |    |   |   |   |    |    |   |
|-------------|---|---|---|----|---|---|---|----|----|---|
|             | 0 | 1 | 2 | 3  | 4 | 5 | 6 | 7  | 8  | 9 |
| $a[1:10] =$ | 2 | 2 | 1 | -3 | 4 | 3 | 1 | -2 | -3 | 2 |

Idea :- for every subarray calculate  $\text{sum} = 0$ .

|              |   |   |   |    |   |   |    |    |    |   |
|--------------|---|---|---|----|---|---|----|----|----|---|
|              | 0 | 1 | 2 | 3  | 4 | 5 | 6  | 7  | 8  | 9 |
| $a[1:10] =$  | 2 | 2 | 1 | -3 | 4 | 3 | 1  | -2 | -3 | 2 |
| $PF[1:10] =$ | 2 | 4 | 5 | 2  | 6 | 9 | 10 | 8  | 5  | 7 |

Obs:- 1) If sum array if value repeats it means there is a subarray with  $\text{sum} = 0$ .

2) If you have a 0 in prefix array the also, subarray sum = 0.

$$arr[] = \{2, -5, 3, 6\}$$

$$PF[] = \{2, -3, 0, 6\}$$

$\rightarrow T.C \rightarrow O(n)$

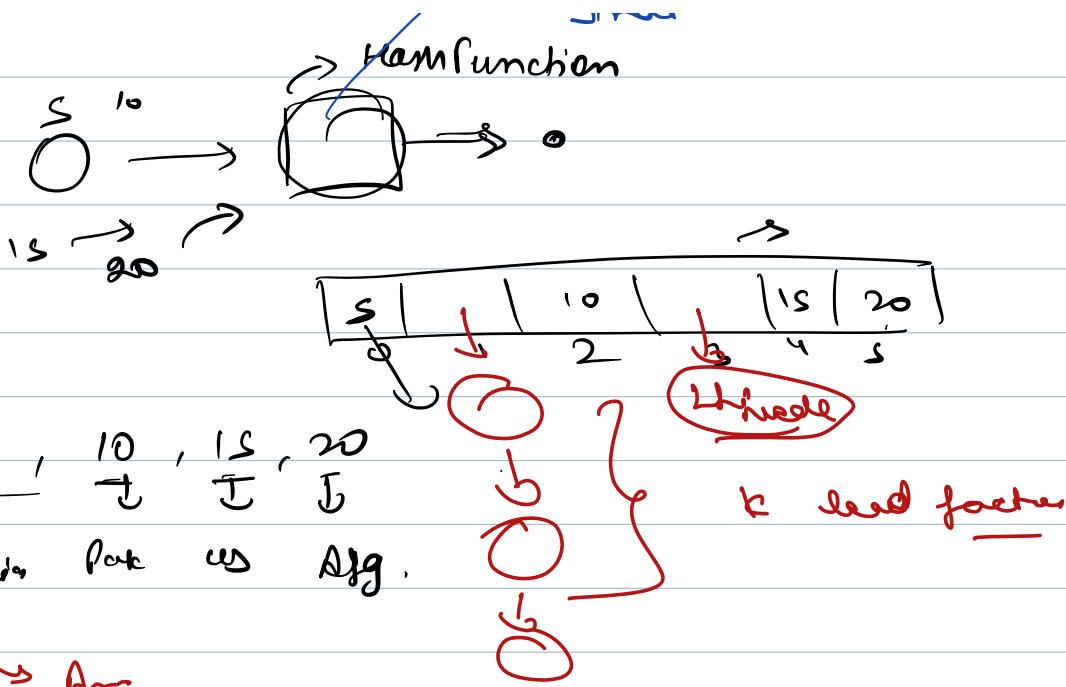

```
bool subarrayzero (int arr[]) {  
    int n = arr.length;  $\rightarrow S.C \rightarrow O(n)$   
    int pf[n]; // Todo constructing it.
```

```
HashMap<int> hs;  
for (i=0; i<n; i++) {  
    if (pf[i] == 0) {  
        return true  
    }  
    hs.insert(pf[i])
```

```
}  
if (hs.size() < n) { // repetition in pf[]  
    return true;  
} else {  
    return false;  
}
```
